Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

Cells expressing DNA are used to convert DA to DO. DO is a well known anticancer agen (II) imparts a high degree of resistance to DO in the host cells and provides a more efficient conversion process. The present sequence represents a DNA consisting of the doxA, dnrV and the C-terminal par the dark (deldnrU) genes. This sequence is the complementary strand
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Sequence
                                                                            661

This DNA sequence comprises a 3196 bp KpnI-SstI DNA fragment of Streptomyces sp. strain C5 containing the doxA gene (see also AAV01447) that codes for daunomycin C-14 hydroxylase (see AAW36128). The DNA fragment also includes the 3' end of orf1 (see also AAW36333), the complete orfA (see AAW36134) and the 5' end of daul AAW36333), the complete orfA (see AAW36134) and the 5' end of daul

PR 24-MAY-1996; 96US-065365D-XX

PA (OHIS ) UNIV OHIO STATE RES FOUND.

XX

PI DeSanti CL, Dickens MI, Strohl MA, XX

PI Producing doxorubicin from daunomycin by daunomycin C14 hydroxylase PT Producing doxorubicin from daunomycin of other anthracycline(s) with PT Producing doxorubicin and oxidation of other anthracycline(s) with PT the same enzyme

XX

PT Producing doxorubicin from daunomycin C-14 hydroxylase pt the same enzyme

PS Claim 11; Page 30-33; 59pp; English.

XX

C1 This DNA sequence comprises the doxA gene of Streptomyces sp.

CC Strain C5 that codes for daunomycin C-14 hydroxylase (DC14H)

CC (see AAW3612B), a P450-like enzyme useful for the production of doxorubicin from daunomycin, and for the hydroxylaston and coxidation of other anthracyclines. The gene was identified by coxidation of other anthracyclines. The gene was identified by coxidation of other anthracyclines. The gene has been incorporated into various vectors, including pANT195 (see AAV01451). Claimed methods for production of coxidation include: the use of a host microorganism transformed with a plasmid which contains the doxA gene; incubating culture confidency in the enzyme can also be used in claimed methods of producing 13-dhydrocarminomycin and carminomycin can daunomycin from 13-deoxycarminomycin, and of producing 13-dhydrocaunomycin can discuss preclude the use of halogens as required in the current chemical methods.

                                                                                                           The present sequence is the drxA gene coding sequence for daunorubicin 14 hydroxylase, isolated from Streptomyces peucetius strain 29050. The enzyme converts daunorubicin to doxorubicin, an anthracycline used widely as an antitumour agent. A vector conty. the drxA gene could be used to transform a suitable host cell which produces daunorubicin, in order to enhance bioconversion of daunorubicin to doxorubicin. Bioconversion can be carried out either by using directly the free or immobilised transformed cells or by isolating the enzyme, which can be used in the free form or immobilised to resins, glass, cellulose or similar substances by ionic or covalent bonds, or grafted to fibres permeable to the substrate or insolubilised by cross-linkage.

The doxA gene codes for daunomycin C-14 hydroxylase (see AAW36128), an enzyme capable of converting daunomycin to the anticancer agent doxorubicin. Host cells, especially Streptomyces host cells, transformed with pANT195 can be used in methods for the production of doxorubicin from daunomycin or the hydroxylation and oxidation of other anthracyclines.

This sequence represents an SstI-AatII restriction fragment from the Streptomyces peucetius genome, which contains the dnrU gene. The invention relates to a recombinant microorganism which produces doxorubicin (DoR), in which at least 1 daunorubicin (DaR) metabolism gene selected from dnrU and dnrX, has been inactivated. The microorganism is preferably S. peucetius wMMH1658, WMH1654 and WMH1662. The function of the DaR gene is inactivated by insertion of a gene (preferably neomycin/kanamycin resistance gene aphlI) into the daunorubicin metabolism gene. The blocking of the function of at least one gene of DaR metabolism can increase DaR and DoR production levels and cause
                                                                                                                                             Production of doxorubicin and daunorubical daunorubicin producing microorganism in w dnrX metabolism gene has been inactivated
                                                                                                                                                                                                                                                                                            28-JUL-1997;

FILING DATE: 3-DEC-1996
CLASSIFICATION: 435
PRIOR APPLICATION DATA:
APPLICATION NUMBER: 08/396,218
FILING DATE: 27-FEB-1995
ATTORNEY,AGENT INFORMATION:
NAME: KITTS, MONICA C
REGISTRATION NUMBER: 36,105
REFERENCE/DOCKET NUMBER: p1615-6007
FELECOMMUNICATION INFORMATION:
TELEPHONE: 202/638-4810
INFORMATION FOR SEC ID NO: 1:
SEQUENCE CHARACTERISTICS:
LENGTH: 1269 base pairs
ILENGTH: 1269 base pairs
TYPE: nucleic acid
STRANDEDNESS: double
TOPOLOGY: linear
MOLECULE TYPE: DNA (genomic)
HYPOTHETICAL: NO
ORIGINAL SOURCE:
ORGANISM: Streptomyces peucetius
FAMURE:
NAME: COC.

                                                          isolated from Streptomyces peucetius strain 2005. The enzyme converts daunorubicin to doxorubicin, an anthracycline used widely as an antitumour agent. A vector contg. the drxA gene (AAT33617) could be used to transform a suitable host cell which produces daunorubicin, in order to enhance bioconversion of daunorubicin to doxorubicin. Bioconversion can be carried out either by using directly the free or immobilised transformed cells or by isolating the enzyme, which can be used in the free form or immobilised the enzyme, which can be used in the
                                                                                                                                                                                                                                                  The present sequence is that of the daunorubicin 14-hydroxylase,
